```

Dataset

This code uses the CIFAR-10 dataset. (https://www.cs.toronto.edu/~kriz/cifar.html)

1. Transform setting

The original images are in PIL (0 to 255 for each pixel). First we convert it to a tensor format (0 to 1). Then to make the data to be zero centering, we make the range to be between -1 to 1. If we use the following equation for each data, we can make it zero centered: \begin{equation} output = \frac{input - mean}{std} \end{equation} This is being done by setting the `mean` and `standard deviation` to be 0.5.

```
transform = transforms.Compose([  transforms.RandomHorizontalFlip(),
                                  transforms.RandomCrop(32, padding=4),
                                  transforms.ToTensor(),
                                  transforms.Normalize((0.4914, 0.4822,
0.4465), (0.2023, 0.1994, 0.2010))
                                  ])
```

2. Making the training set

Now we load the actual dataset and make the training dataset.

1. Load CIFAR10 dataset (Download and prepare dataset)
    a. Put it in `./data_CIFAR10` directory.
    b. Download it
    c. Do the specified transformation on the dataset
2. Create the data loader (pipelining settings)
    a. Brake it to batches with size of 32
    b. Shuffle the deck in every epoch
    c. Use 4 number of workers to make the training faster

```
batchSize = 256
numberOfWorkers = 0

trainSet = torchvision.datasets.CIFAR10(root='./data_CIFAR10',
                                         train=True,
                                         download=True,
                                         transform = transform)

trainLoader = torch.utils.data.DataLoader(trainSet,
                                           batch_size=batchSize,
                                           shuffle=True,
                                           num_workers=numberOfWorkers,
                                           pin_memory=True,
                                           persistent_workers=False)
```

3. Making the test set

Now making the test set. The procedure is the same as making the training set with some minor modifications.

```
testSet = torchvision.datasets.CIFAR10(root='./data_CIFAR10',
                                        train=False,
                                        download=True,
                                        transform=transform)

testLoader = torch.utils.data.DataLoader(testSet,
                                          batch_size=batchSize,
                                          shuffle=False,
                                          num_workers=numberOfWorkers,
                                          pin_memory=True,
                                          persistent_workers=False) #
Updated here too
viz_batchSize = 4
vizLoader = torch.utils.data.DataLoader(testSet,
batch_size=viz_batchSize, shuffle=True)
```

4. The classes

```
classes = ('plane', 'car', 'bird', 'cat', 'deer', 'dog', 'frog',
'horse', 'ship', 'truck')
pprint(classes)
```

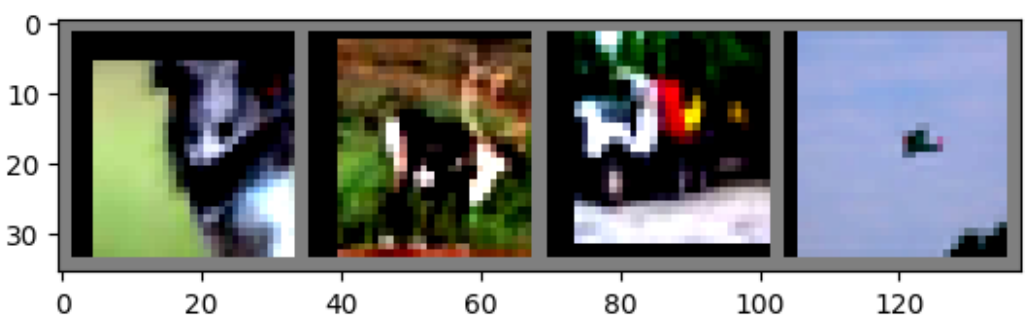
```
('plane', 'car', 'bird', 'cat', 'deer', 'dog', 'frog', 'horse',
'ship', 'truck')
```

DEUBG1

Showing some of the images from the dataset.

```
# functions to show an image
def imshow(img):
  img = img / 2 + 0.5 # unnormalize
  npimg = img.numpy()
  plt.imshow(np.transpose(npimg, (1, 2, 0)))
  plt.show()
# get some random training images
dataiter = iter(vizLoader)
images, labels = next(dataiter)
# show images
imshow(torchvision.utils.make_grid(images))
# print labels
pprint(' '.join(f'{classes[labels[j]]:5s}' for j in
range(viz_batchSize)))
```

```
Clipping input data to the valid range for imshow with RGB data
([0..1] for floats or [0..255] for integers). Got range [-
0.71453285..1.8183348].
```



```
'bird  deer  truck plane'
```

5. Defining the CNN model

```
class Net(nn.Module):
  def __init__(self):
```

```
    super(Net, self).__init__()
    self.conv1 = nn.Conv2d(in_channels=3, out_channels=32,
kernel_size=3)
    self.pool1 = nn.MaxPool2d(kernel_size=2, stride=2)
    self.conv2 = nn.Conv2d(in_channels=32, out_channels=64,
kernel_size=3)
    self.pool2 = nn.MaxPool2d(kernel_size=2, stride=2)
    self.conv3 = nn.Conv2d(in_channels=64, out_channels=64,
kernel_size=3)
    self.fc1 = nn.Linear(64 * 4 * 4, 64)
    self.fc2 = nn.Linear(64, 10)

  def forward(self, x):
    x = self.pool1(nnFunc.relu(self.conv1(x)))
    x = self.pool2(nnFunc.relu(self.conv2(x)))
    x = nnFunc.relu(self.conv3(x))

    x = x.view(-1, 64 * 4 * 4)

    x = nnFunc.relu(self.fc1(x))
    x = self.fc2(x)

    return x
```

6. Instansiating the CNN model

```
def init_weights(m):
    if isinstance(m, nn.Conv2d) or isinstance(m, nn.Linear):
        nn.init.kaiming_normal_(m.weight, mode='fan_out',
nonlinearity='relu')
        if m.bias is not None:
            nn.init.constant_(m.bias, 0)
net = Net()
net.apply(init_weights)
```

```
Net(
  (conv1): Conv2d(3, 32, kernel_size=(3, 3), stride=(1, 1))
  (pool1): MaxPool2d(kernel_size=2, stride=2, padding=0, dilation=1,
ceil_mode=False)
  (conv2): Conv2d(32, 64, kernel_size=(3, 3), stride=(1, 1))
  (pool2): MaxPool2d(kernel_size=2, stride=2, padding=0, dilation=1,
ceil_mode=False)
  (conv3): Conv2d(64, 64, kernel_size=(3, 3), stride=(1, 1))
  (fc1): Linear(in_features=1024, out_features=64, bias=True)
  (fc2): Linear(in_features=64, out_features=10, bias=True)
)
```

7. Move the model to GPU

```
device = torch.device('cuda:0' if torch.cuda.is_available() else
'cpu')
print(device)
```

```
cuda:0
```

```
net.to(device)
```

```
Net(
  (conv1): Conv2d(3, 32, kernel_size=(3, 3), stride=(1, 1))
  (pool1): MaxPool2d(kernel_size=2, stride=2, padding=0, dilation=1,
ceil_mode=False)
  (conv2): Conv2d(32, 64, kernel_size=(3, 3), stride=(1, 1))
  (pool2): MaxPool2d(kernel_size=2, stride=2, padding=0, dilation=1,
ceil_mode=False)
  (conv3): Conv2d(64, 64, kernel_size=(3, 3), stride=(1, 1))
  (fc1): Linear(in_features=1024, out_features=64, bias=True)
  (fc2): Linear(in_features=64, out_features=10, bias=True)
)
```

8. Degine loss function and optimizer

```
criterion = nn.CrossEntropyLoss()
optimizer = optim.Adam(net.parameters(), lr=0.001)
scheduler = optim.lr_scheduler.ReduceLROnPlateau(optimizer,
mode='max', factor=0.1, patience=10)
```

9. Traing the network

```
scaler = amp.GradScaler('cuda')

epochs = 100
printFrequency = len(trainLoader) // 4

for epoch in range(epochs):
    net.train()
    running_loss = 0.0
    correct = 0
    total = 0

    # --- TRAINING PHASE ---
    for i, data in enumerate(trainLoader, 0):
        inputs, labels = data[0].to(device, non_blocking=True),
data[1].to(device, non_blocking=True)

        optimizer.zero_grad()

        with amp.autocast('cuda'):
```

```
            outputs = net(inputs)
            loss = criterion(outputs, labels)

        scaler.scale(loss).backward()
        scaler.unscale_(optimizer)
        torch.nn.utils.clip_grad_norm_(net.parameters(), max_norm=1.0)

        scaler.step(optimizer)
        scaler.update()

        _, predicted = torch.max(outputs.data, 1)
        total += labels.size(0)
        correct += (predicted == labels).sum().item()
        running_loss += loss.item()

        if i % printFrequency == (printFrequency - 1):
            accuracy = 100 * correct / total
            print(f'Epoch {epoch + 1} | Batch {i +
1}/{len(trainLoader)} | loss: {running_loss / printFrequency:.3f} |
acc: {accuracy:.2f}%')
            running_loss, correct, total = 0.0, 0, 0

    # --- VALIDATION PHASE ---
    net.eval()
    val_correct = 0
    val_total = 0
    with torch.no_grad():
        for data in testLoader:
            images, labels = data[0].to(device), data[1].to(device)
            with amp.autocast('cuda'):
                outputs = net(images)

```

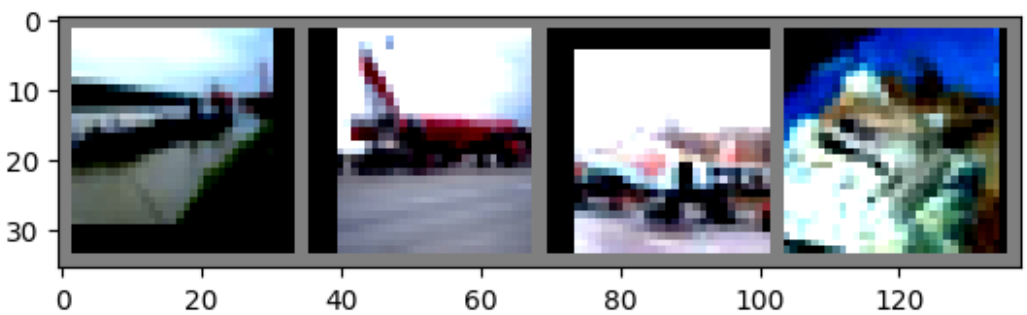
10. Test the network on the test data

```
dataIter = iter(vizLoader)
images, labels = next(dataIter)
# print images
imshow(torchvision.utils.make_grid(images))
print('GroundTruth: ', ' '.join(f'{classes[labels[j]]:5s}' for j in
range(viz_batchSize)))
```

```
Clipping input data to the valid range for imshow with RGB data
([0..1] for floats or [0..255] for integers). Got range [-
0.71453285..1.8768656].
```



```
GroundTruth:  ship  plane plane frog
```

```
images, labels = images.to(device), labels.to(device)

outputs = net(images)
_, predicted = torch.max(outputs, 1)

print('Predicted: ', ' '.join(f'{classes[predicted[j].item()]:5s}' for
j in range(len(predicted))))
```

```
Predicted:  ship  truck plane frog
```

11. Test the network on the whole dataset

```
test_loss = 0.0
correct = 0
total = 0

with torch.no_grad():
```

```
    for data in testLoader:
        images, labels = data[0].to(device), data[1].to(device)

        outputs = net(images)

        # 1. Calculate the loss for this batch
        loss = criterion(outputs, labels)
        test_loss += loss.item()

        # 2. Calculate accuracy as before
        _, predicted = torch.max(outputs, 1)
        total += labels.size(0)
        correct += (predicted == labels).sum().item()

# Calculate the average loss over all batches
avg_test_loss = test_loss / len(testLoader)

print(f'Test Loss: {avg_test_loss:.4f}')
print(f'Test Accuracy: {100 * correct / total:.2f}%')
```

```
Test Loss: 0.6264
Test Accuracy: 79.27%
```

12. Check performance within each class

```
# prepare to count predictions for each class
correct_pred = {classname: 0 for classname in classes}
total_pred = {classname: 0 for classname in classes}

# again no gradients needed
with torch.no_grad():
    for data in testLoader:
        images, labels = data[0].to(device), data[1].to(device)
        outputs = net(images)
        _, predictions = torch.max(outputs, 1)
        # collect the correct predictions for each class
        for label, prediction in zip(labels, predictions):
            if label == prediction:
                correct_pred[classes[label]] += 1
            total_pred[classes[label]] += 1

# print accuracy for each class
for classname, correct_count in correct_pred.items():
    accuracy = 100 * float(correct_count) / total_pred[classname]
    print(f'Accuracy for class: {classname:5s} is {accuracy:.1f} %')
```

```
Accuracy for class: plane is 77.9 %
